# The Changing Nature of Work

- Personnel will increasingly need to adapt to changing conditions in the workplace.
- Personnel will increasingly be involved in team- and project-based work.
- Workers will change jobs, organizations, and careers more frequently.
- Organizations will increasingly rely on contingent, short-term personnel.

*(Source: Murphy, 1999)*

# Overview

Discuss the design of a job classification database to illustrate:

1. principles of information management
2. best practices in information management and database design
3. common misconceptions about relational databases

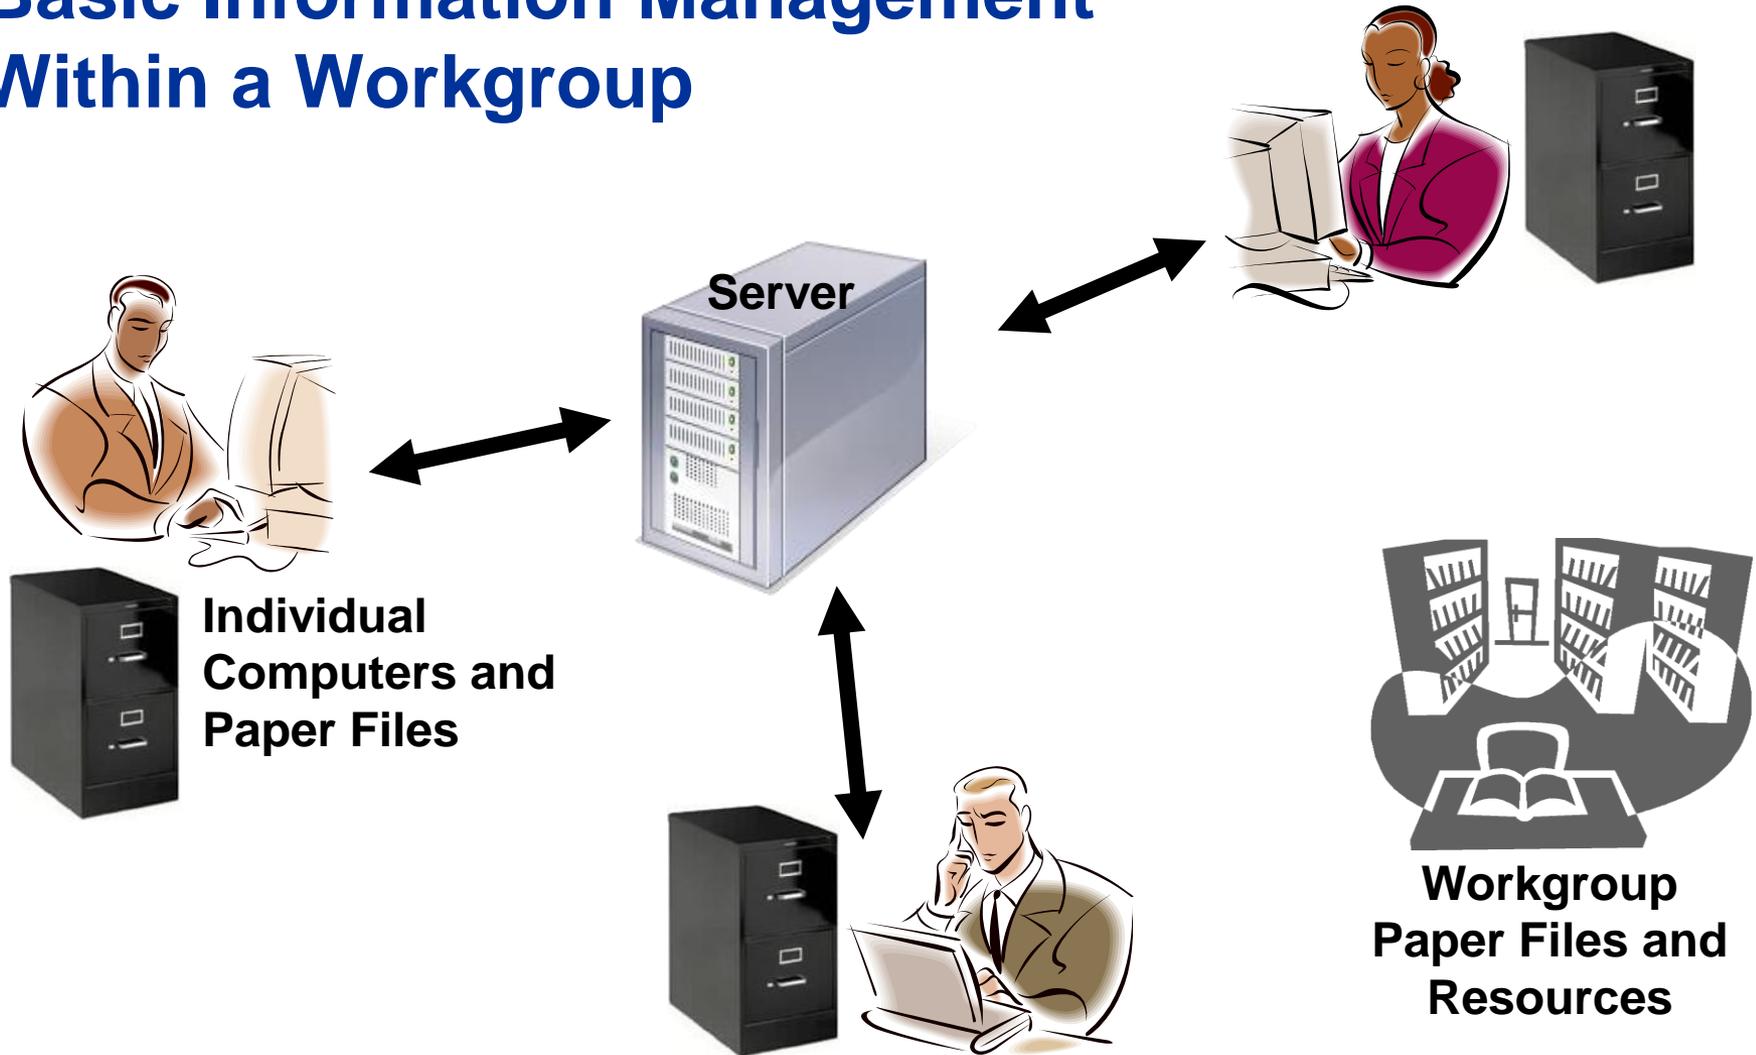

# What is Information Management?

Information management consists of the methods used to gather, organize, store, manipulate, analyze, and disseminate information.

Systems involved can include:

- Individual employees' computers
- Shared servers or LANs
- Software and applications
- Paper and electronic files
- Intranet; Internet
- System administrators

# Basic Information Management Within a Workgroup

## Cautions

### **Shared information is difficult to use**

- Problems with version control
- Too much unimportant information
- Information is difficult to find

### **Information can still be stovepiped**

- Important information is not shared
- Redundant information
- Contradictory information

# Potential Symptoms of an IM Problem

- Generalists and new hires feel uncomfortable making classification decisions.
- Knowledge of, and adherence to, classification policies and procedures is inconsistent.
- Substantial information about classification procedures and about specific job classes is not recoverable after an employee leaves.
- Classification decisions contradict one another.
- The classification plan consists of many nearly-identical classifications; there are too many classes.

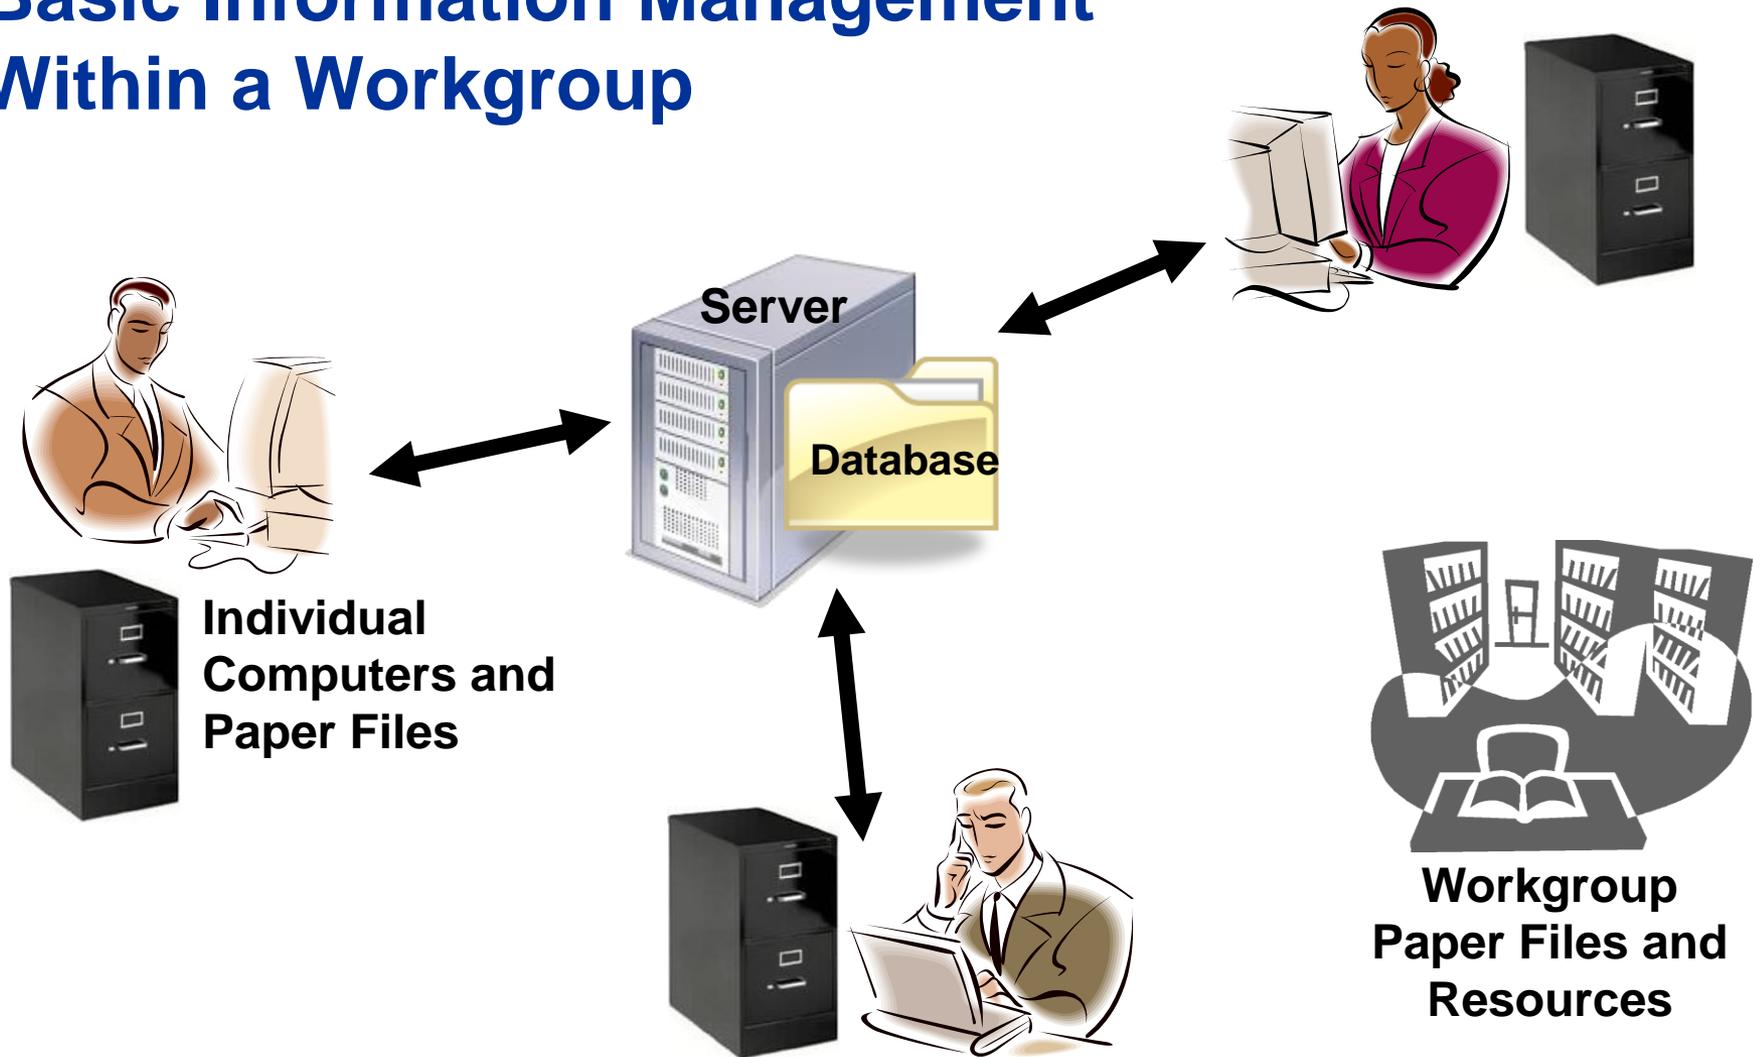

# Recommendations

## Centralize and Structure Information in Paper Files and on the Server

- Establish rules about what information will be stored electronically, and where paper documents will live
- Establish rules about what information should be shared
- Establish naming conventions

## Utilize a Relational Database for Information Necessary to a Process...

# Basic Information Management Within a Workgroup

# Advantages of the Relational Database (Part I)

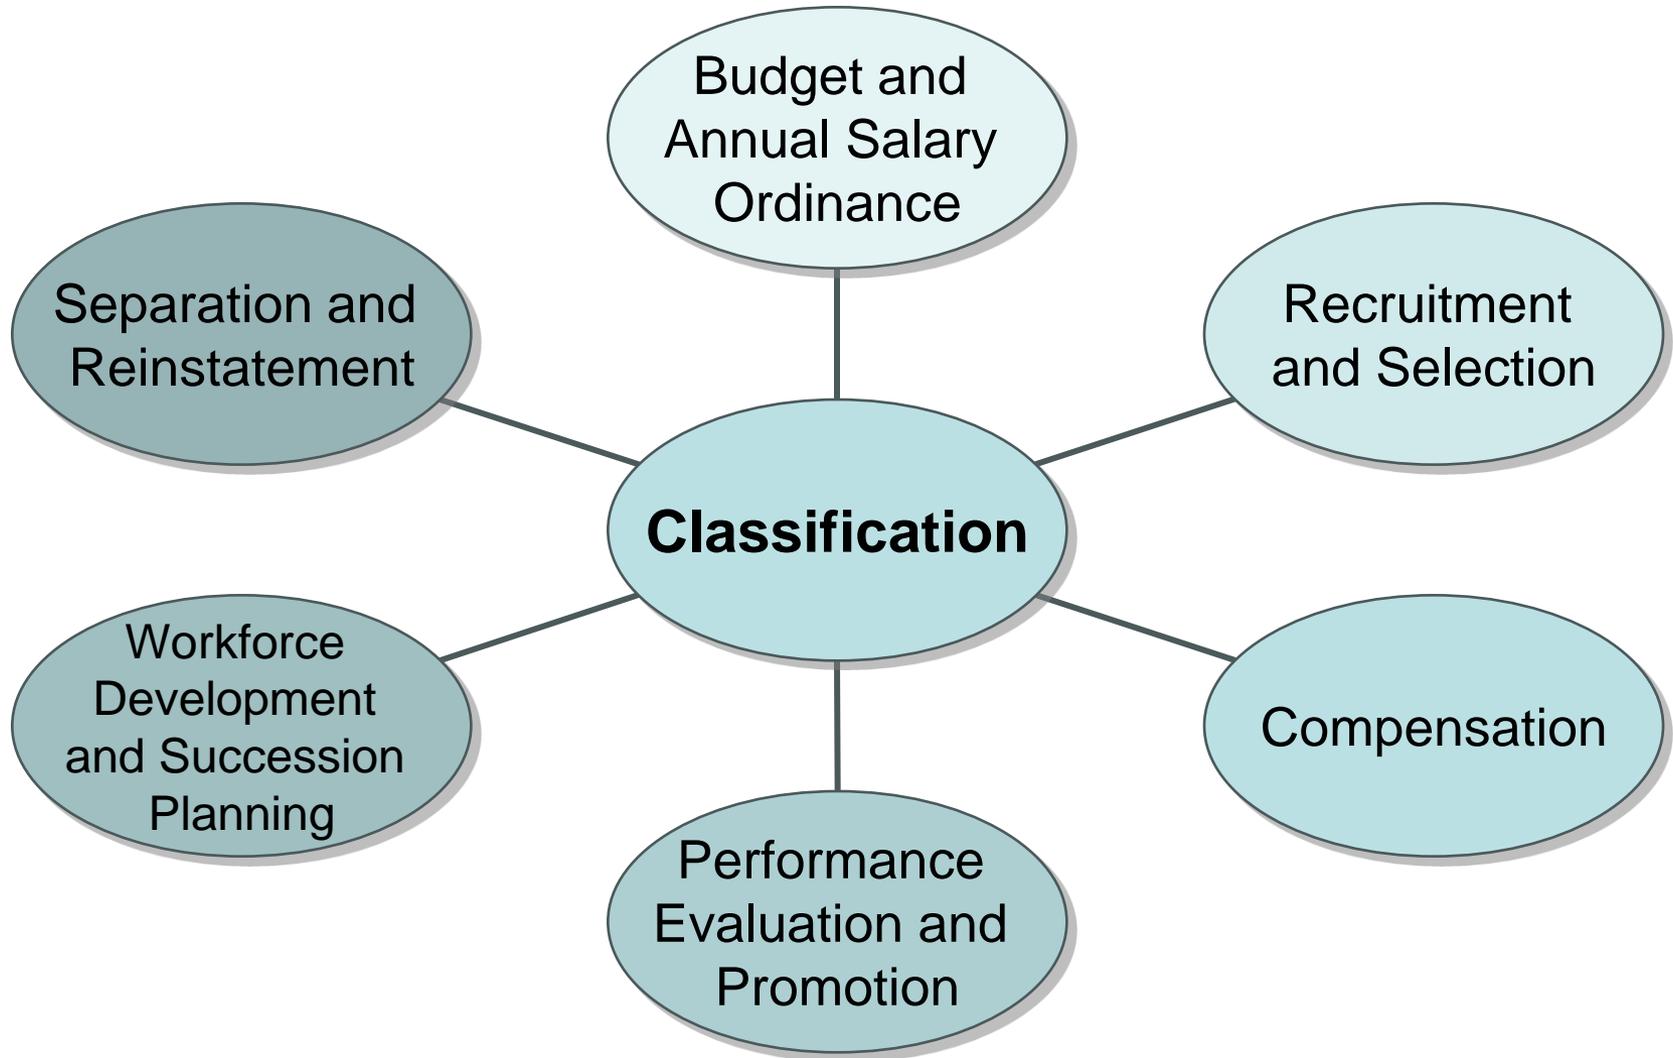

## Minimize Redundancy

- Update information in one place instead of in multiple flat files
- Identify missing or contradictory information without having to open multiple flat files

## Quality Control

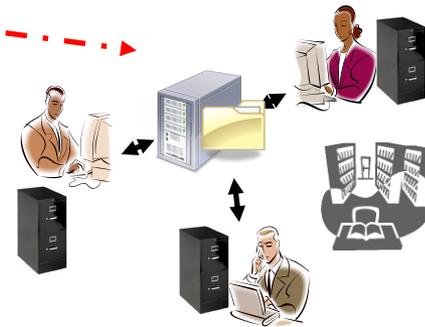

- Create validation rules for data entry
- Establish standard report formats
- Ensure that the most up-to-date information is used

# Interconnectivity of Classification Actions

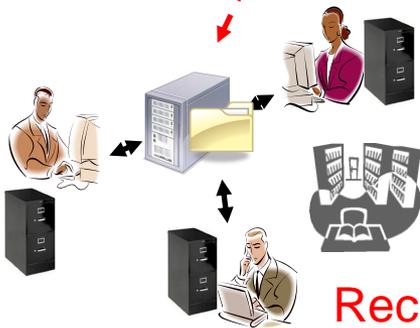

# Departmental Information Management

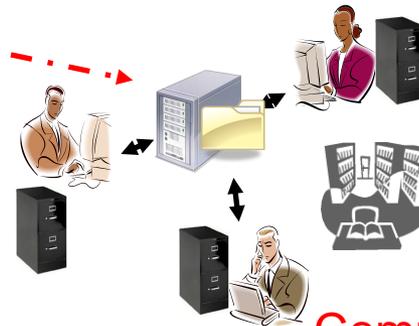

## Department Server and Paper Files

Classification

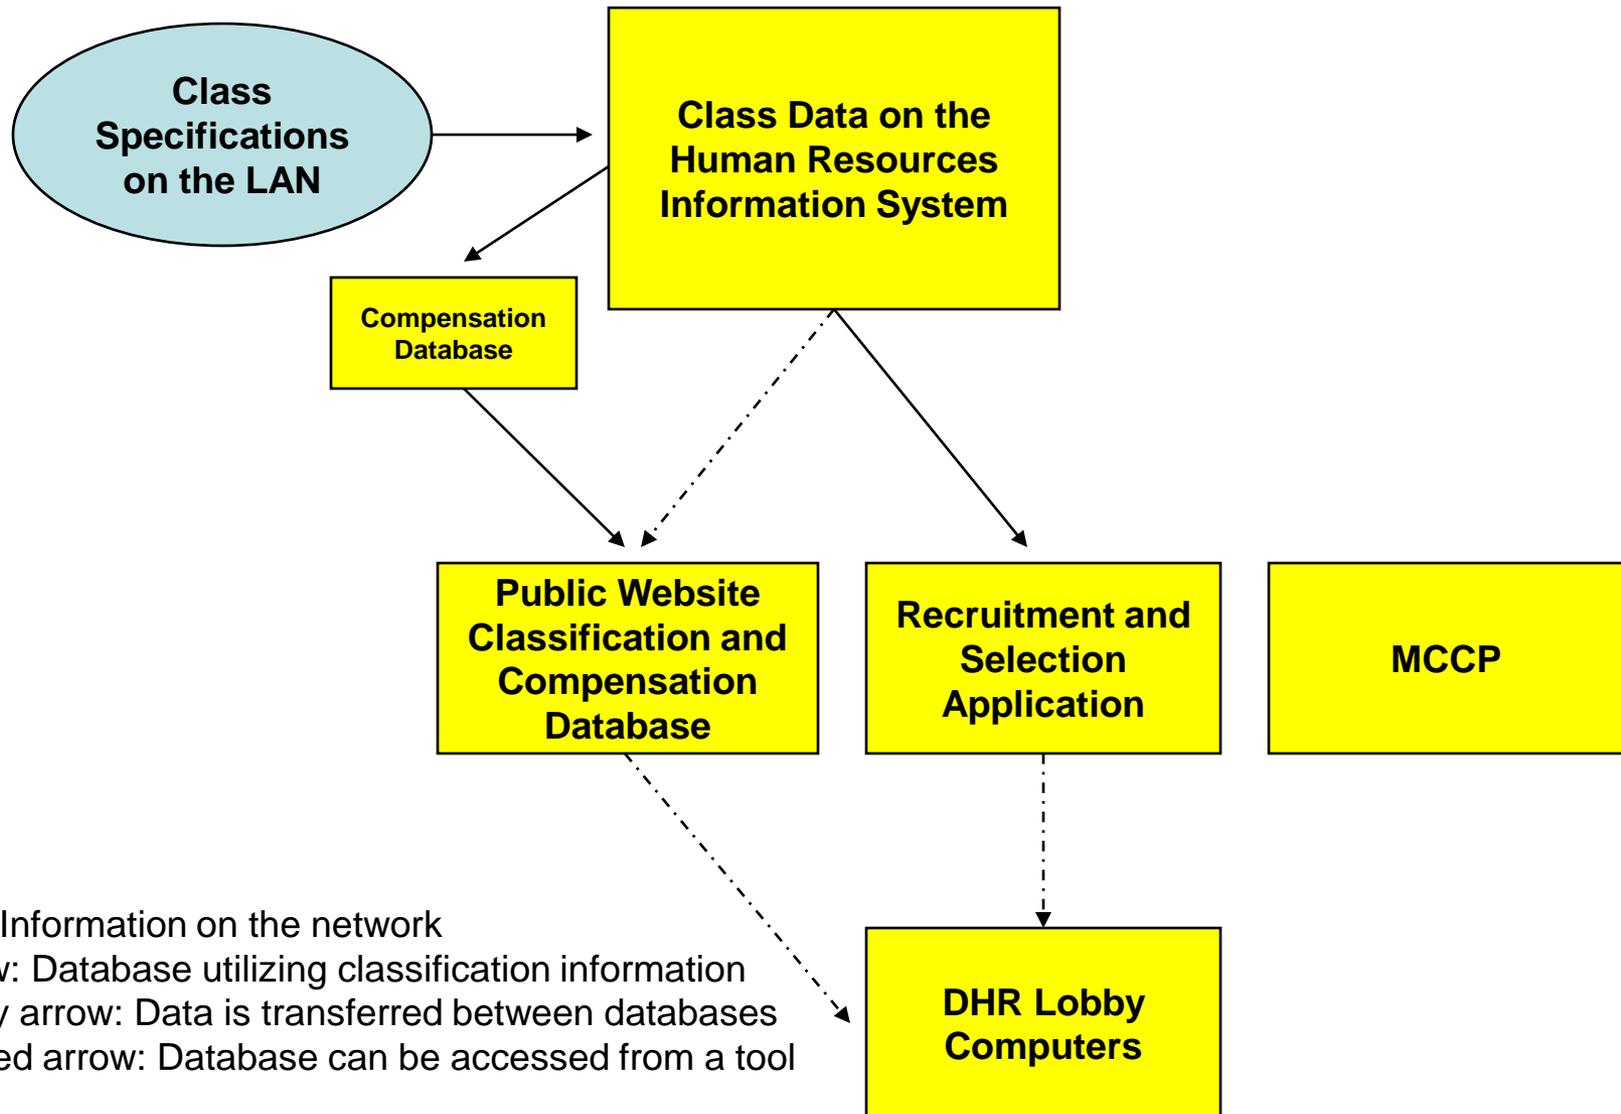

Recruitment and Selection

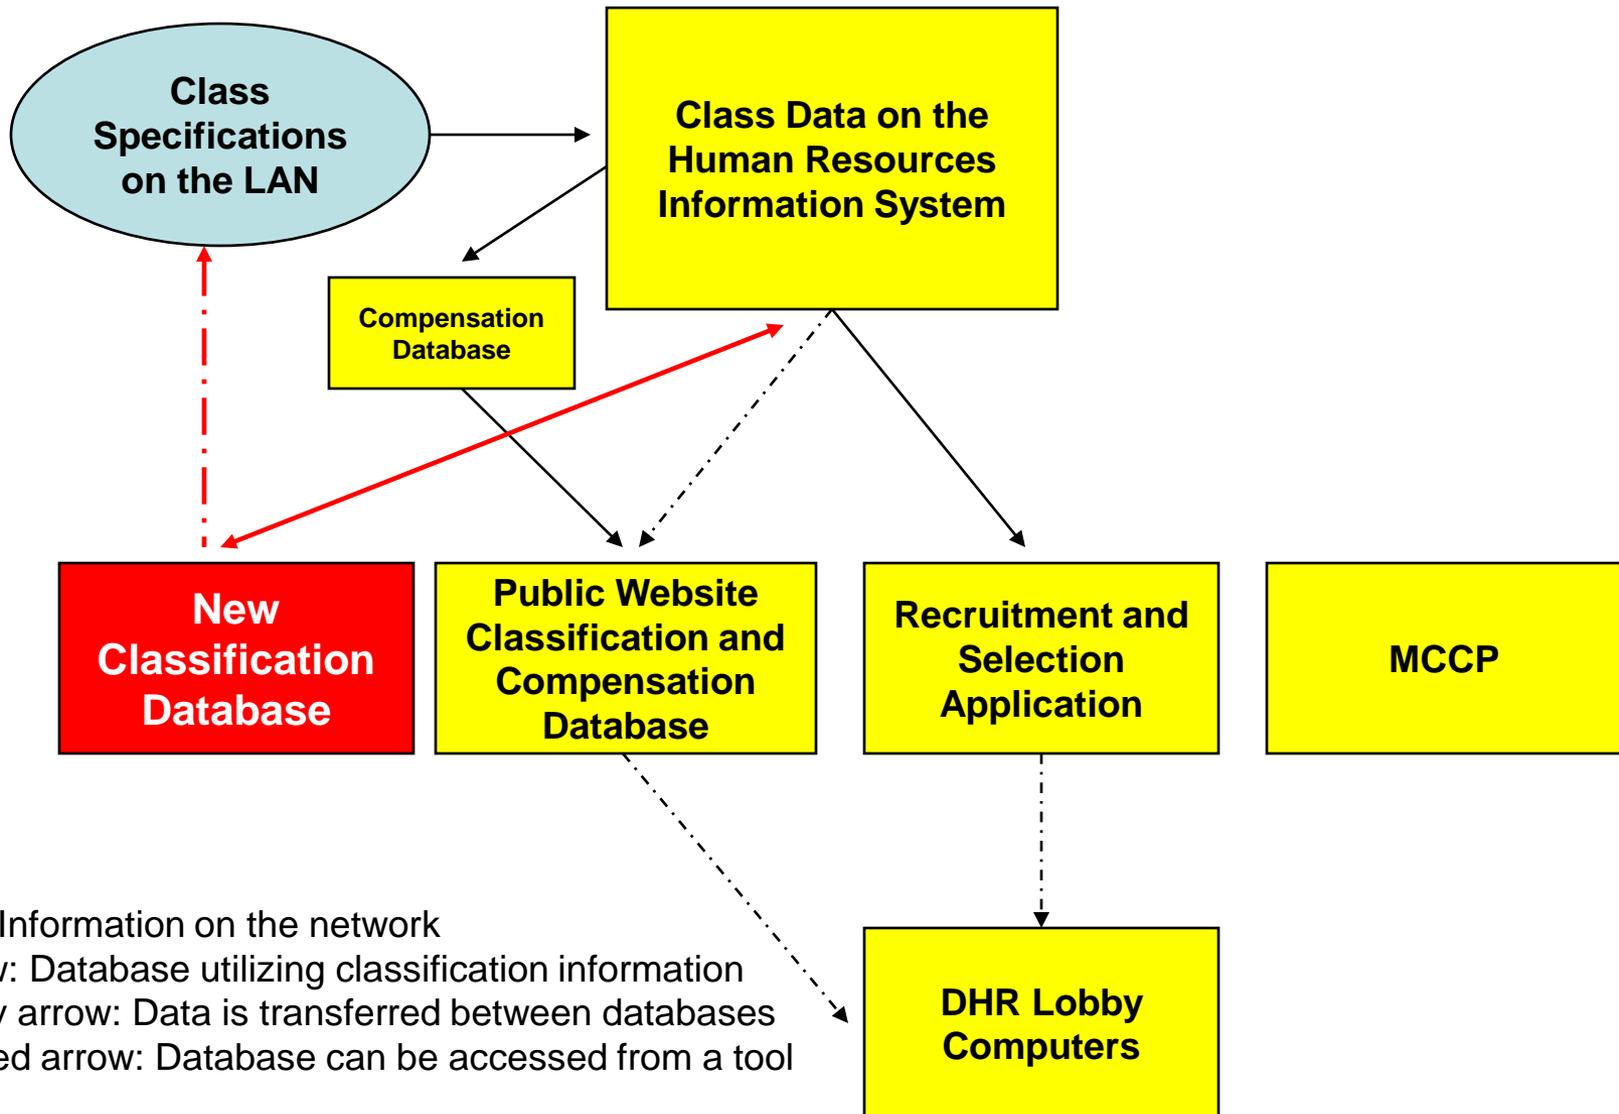

Compensation

# Classification Data Flow: Existing

# Classification Data Flow: Proposed

# Advantages of the Relational Database (Part II)

## Centralize Non-Database Information

- Automatically retrieve and integrate information from other databases
- Create controls to view documentation, policies, and archives

## Institute Change

- Institutionalize essential procedures
- Promote certain information as relevant to decision-making
- Establish tracking functions to assign responsibilities and monitor progress

# Realistic Expectations About a Database

- Developing a good database requires the most investment of time and energy in the design phase.
- A database is only as good as the information put in it.
- A database still requires periodic maintenance and auditing. Changes to the database and to the information management system should be expected.
- A database is not a substitute for statistical software.
- MS Access is not always the best option, particularly if the database intended to be used widely or if it will reside online.
- Orientation and documentation is helpful to encourage use of the system. Expect an adjustment process.

# Principles Underlying Our Database

- Introduce no new data redundancies; reduce data redundancies where possible
- Coordinate centralization of electronic records with centralization of paper records
- Conformance to DHR policies and procedures
- Provide analysts with the tools needed to make good decisions
- Facilitate and track transition to new class spec format
